## T2D TORRENS TO DARLINGTON

### Tunnel safety systems

The T2D motorway will have a range of technology-based information, communications and control systems.

These actively manage traffic flows and improve safety, as well as providing better travel time reliability.

#### 1 Tunnel closure system

Ensures the tunnels can be safely closed when required, using boom gates and stop signals.

#### 2 Ventilation fans

Maintain air quality in the tunnels.

#### 3 Automatic incident detection

Allows rapid automatic detection of hazards such as stopped vehicles, debris, animals or people.

#### 4 CCTV

Cameras along the motorway allow constant road monitoring for quick incident management.

#### 5 Dynamic variable message signs (VMS)

Provide information like incident warnings and likely travel time.

#### 6 Lane use management system

Controls variable speeds and lane closures for optimised traffic flow and safety.

#### 7 Vehicle detection systems

Monitor travel times and unusual congestion.

#### 8 Tunnel egress points

Spaced every 120m to provide emergency access between the parallel tunnels.

#### 9 Fire detection and suppression systems

Smoke detectors are automatically triggered, and sprinklers can be activated, in the event of a fire.

#### 10 Radio rebroadcasting

Allows traffic management centre personnel to broadcast safety messages to motorists in the tunnels via their vehicle's radio.
